The objectives of the project “Alternative PROteins from Microbial fermentation of non-conventional SEA sources for Next-Generation food, feed and non-food bio-based applications (PROMISEANG)” is to develop novel alternative proteins from marine underexploited sources, mainly marine invertebrate and macroalgae discards and industrial biowastes, through solid-state fermentation, to generate new protein-enriched microbial biomass, which is known as single cell proteins (SCP), meeting market requirements for food, feed, and non-food (biomedicine, pharma and cosmetic) bio-based applications. Research on novel protein streams from sustainable alternative sources will contribute to increase the protein availability in the EU and reduce the actual dependency on imports.

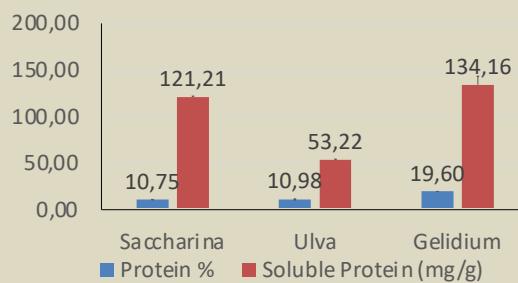

Characterization of macroalgae

	% Moisture	% Ash	% Extractives
Gelidium waste	7.81 ± 0.12	27.38 ± 1.62	11.16 ± 0.35
Saccharina sp	11.26 ± 0.04	35.44 ± 0.80	44.65 ± 0.37
Ulva rigida	15.93 ± 0.12	32.91 ± 0.87	68.37± 1.12
